

HASHCASE / APPLIED AI

AI that gets the work done.

End-to-end workflow automation and
private AI systems built around your
operations.

CLIENT CAPABILITIES / SEPTEMBER 2026

From scattered inputs to approved outcomes.

HashCase designs the complete path from source material to a finished, reviewable business result.

READ THE WORK

Documents, audio, images and connected systems

APPLY JUDGMENT

Grounded models, rules and staff review

FINISH THE TASK

Approved outputs, records and actions

A routine request becomes five handoffs

Illustrative example: a request arrives by email with a scanned form and a voice note.

The hard part is locating evidence, checking rules, getting approval and updating the system — all in one controlled run.

Four gaps behind one unfinished task

01

Fragmented intake

Files and messages arrive without a reliable, shared case record.

02

Weak evidence

Teams need to verify names, numbers and source claims manually.

03

Disconnected action

A draft answer still needs staff to move it between systems.

04

Unclear boundary

Sensitive material needs explicit rules for access and model use.

The workflow must carry evidence, approval and action together.

Two capabilities. One operating standard.

01

Applied AI workflow automation

Intake → evidence → model and rules → review
→ approved action

02

Private model deployment and tuning

Inference, retrieval, data, logs and lifecycle inside a
client-controlled boundary

Built as products your team can run, inspect and improve.

An automation that carries work to completion

Every stage has an input, an output, a failure path and an owner.

Built to handle retries, invalid inputs and partial failure — with state your team can see.

Built around your documents, decisions and systems

DOCUMENT OPERATIONS	PDFs, scans, forms and attachments	→	Validated fields, review-ready records and exception queues
KNOWLEDGE WORK	Approved internal policies and reference material	→	Sourced answers, reports and reusable institutional knowledge
MULTI-SYSTEM OPERATIONS	Requests, business APIs and approval chains	→	Tracked actions, recovery from partial failure and clear ownership
MULTIMODAL PRODUCTION	Audio, notes, images and source documents	→	Multilingual text and approved visual or video assets

Your AI stays inside your boundary.

We deploy inference, retrieval and approved model adaptation in infrastructure you control.

Data paths, identity, network egress and logs are specified and tested for the deployment.

A data boundary you can inspect

The exact boundary is mapped to your infrastructure, access model and approved integrations.

Unapproved external model calls are blocked by policy when the agreed private boundary requires it.

Quality is tested at every layer

01	PROGRAMMATIC	Schemas, identifiers, numbers and safe state transitions
02	CONTENT	Source coverage, unsupported claims, terminology and language
03	TRAJECTORY	Tool choices, arguments, loops and final system state
04	FAILURE CASES	Conflicts, malformed inputs, timeouts and recovery
05	OPERATIONS	Latency, throughput, task cost and regression after change

The client sees acceptance evidence, release criteria and the rollback path.

Keep consequential decisions with your team

We place approval gates where a wrong fact or outward action would matter.

01

CORRECT THE SOURCE

Staff inspect extracted text, names and fields before generation.

02

REVIEW THE RESULT

The draft carries evidence, exceptions and editable output.

03

APPROVE THE ACTION

Publication or system changes follow the client's authority rules.

The approval design can differ by task: staff may review every output, only exceptions, or only outward actions.

Official inputs to reviewed public communication

For Maharashtra Government DGIPR, HashCase built a Marathi-first platform in production use.

Safeguards include tracked jobs, verified names and terminology, source checks, schema rules and officer approval.

Current DGIPR workflows use approved external AI services for several tasks. Private deployment is a separate offering.

Start with one high-value workflow

We agree on the work to automate, the data boundary and the evidence required before expansion.

01

MAP

Source systems, decisions, handoffs and cost of errors

Workflow map + acceptance cases

02

BUILD

Intake, model, rules, review and integration in a working pilot

Usable interface + connected pipeline

03

PROVE

Representative and edge cases against the current baseline

Evaluation record + failure modes

04

OPERATE

Logging, versioning, rollback and ownership

Release plan + handover

The outcome is a working process and a documented decision on how to scale it.

WHAT WE CAN BUILD TOGETHER

Bring us one workflow worth fixing.

We will map it, build a working pilot and
prove it against your real cases.
